The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 7; Fig 10; 117pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     strains - useful for prodn. of antibodies or diagnosis of, N. meningitidis infection

The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningliddis on by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningliddis infection. The antigen may also be used to detect antibodies specific to N. meninglitidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neisseria meningitidis antigen, highly conserved between different strains - useful for prodn. of antibodies for immunisation against, or diagnosis of, N. meningitidis infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1996-443187/44.

The isolated from 4 strains of N. meningliddis (AAR79039 to AAR79042). The isolate from 4 strains of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis

The 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidi by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neisseria meningitidis antigen, highly conserved between different
strains - useful for prodn. of antibodies for immunisation against,
or diagnosis of, N. meningitidis infection

                                                                                                                                                                                                                                                                                                                                                       (iii) mixtures of 1 or more Neisserial protein and 1 or more Neisserial nucleic acid. The proteins and nucleic acids are preferably from different Neisseria spp., especially Neisseria meningitidis and Neisseria gonorrhoeae, but may be from the same species. A claimed composition includes the NapA protein, preferably in mature form. The compositions are used e.g. as immunogenic compositions, vaccines or diagnostic reagents. They are used to treat or prevent Neisserial infection, to detect the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria, and/or as reagents which can raise antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of the Neisseria meningitidis NspA protein, which contains 8 transmembrane beta-strands and 4 surface-exposed connected loops. Recombinant NspA is being

Neisseria meningitidis antigen, highly conserved between different
strains - useful for prodn. of antibodies for immunisation against,
or diagnosis of, N. meningitidis infection
                                                                                                                                                                    Example 9 describes the epitope mapping of the 22 kD N. meningitidis protein. Identification was accomplished using 18 overlapping synthetic peptides (AAW04895 to AAW04912).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neisseria meningitidis; epitope; mapping; antibody; detection; probe; surface protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAR73911 is the Neisseria meningitidis opacity related protein POPM3. It contains the meningitis related antigenic sequences (MRHAS) claimed in AAR73889 and AAR73901, which are recognised by a monoclonal antibody from the hybridoma Rubella virus (RV)-1. The claimed MRHAS peptides may be used in immunoassays to diagnose the presence of bacterial and/or viral meningitis agents in a sample, or in prophylactic and therapeutic meningitis treatments. The peptides may also be used as vaccines against meningitis.

NB: Identified by matching corresponding MRHAS peptides.

One or more surface exposed loops of this protein may be replaced with a modified peptide of the invention. Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recembinant outer membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                environment in the recombinant outer membrane protein. Finbrin protein is produced by culturing a transformed microbial host, pref. E.coli, Sporodoptera frugiperda or a mucosal pathogen. Finbrin protein (FP) produced by this process is claimed. The FP protein migrates in polyacrylamide genes to a posn. equiv. to a mol. wt. of 25.5 kD or 37.5 kD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The fimbrin proteins from 15 randomly selected type b and non-typable clinical isolates of Haemophilus influenzae share common epitopes. Thus frimbrin isolated from non-typable Haemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vaccine comprising non-typable Haemophilus influenza fimbrin protein - useful in studying, preventing or reducing the severity of otitis media, also fimbrin protein and DNA.

                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 12
                                                                                                                                                                                                                                                                                                                                                                                                                                   CC protein, OmpA2, from Actinobacillus pleuropneumoniae (APP) strain C P2420 (ARCC 98930). The invention relates to the novel APP outer CC membrane proteins Omp20, OmpW, OmpA2, OmpA1 and OmpA2 (ARY97896-Y97900) CC and to nucleic acids encoding them (AAA38554-A38585). APP is a Gram CC negative cocobacillus which is one of the most important swine CC pneumonic pathogens. 12 different serotypes of APP have been recognised CC which vary in geographic distribution. Prior art attempts at vaccinating CC against APP have produced mainly serotype-specific immune responses. In CC contrast, natural immunity to any one serotype seems to confer CC significant protection from disease caused by other serotypes, suggesting CC that natural exposure induces cross-reactive immunity to shared antigens. CC The novel outer membrane proteins of the invention are present in all 12 cc. Serotypes, and may provide a target for cross-protective immunisation. CC The novel outer membrane proteins and nucleic acids encoding them can be companied for the attractive apainst APP in swine. They can also be used as

                                                                        ş
                                                                                                                                                                                                     genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella Chevention is also useful for the identification of potential new targets of antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery for homologous nucleic acids which are required for cell proliferation in casential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part contains the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAU34556

                                                                                        AAY36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

```
A; Experimental source: strain F62-SF, serogroup IB-3; clone F62-SFG1
A; Note: the authors did not translate the sequence of the signal peptide
A; Note: expression of opacity proteins is regulated by the number of tran
of repeats place the start codon in frame with the rest of the protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A;Experimental source: strain JS3
A;Note: 241-Val was also found
A;Note: expression of opacity proteins is regulated by the number of translated
of repeats place the start codon in frame with the rest of the protein
